# Finding Diverse Strings and Longest Common Sequences in a Graph

Seminar for the course of Bioinformatics

Luca Lombardo

Based on the work of: Yuto Shida, Giulia Punzi, Yasuaki Kobayashi, Takeaki Uno, Hiroki Arimura

#### Structure of the Presentation

- Introduction to the problems
  - Diverse Strings Problems
  - Σ-DAG for LCSs
- Exact Algorithms for Bounded Number of Diverse Strings
  - Max-Min Diverse String Set problem
  - Max-Sum Diverse String Set problem
- 3 Approximation Algorithms for Unbounded Number of Diverse Strings
  - Approximation Algorithm for MAX-MIN DIVERSE STRING SET problem
- 4 FPT Algorithms for Bounded Number and Length of Diverse Strings
- 5 Complexity Results for Diverse String Problems

# Longest Common Subsequence (LCS)

#### **Definition**

Given a set of m strings  $S = \{S_1, S_2, \dots, S_m\}$ , a **common subsequence** (CS) is a sequence that appears in all m strings. A **longest common subsequence** LCS is a common subsequence of maximum length. We denote the set of all LCSs of S as LCS(S).

#### Goal

The goal is to find a diverse set of solutions to the LCS problem under the Hamming distance.

#### Definition

Given two strings  $X, Y \in \Sigma^r$ , the **Hamming distance** between X and Y, denoted with  $d_H(X, Y)$ , is the number of positions at which the corresponding symbols differ.

# Efficient methods for finding a diverse set of solutions

More formally, let's consider the following two diversity measures for a multiset  $\mathcal{X} = \{X_1, X_2, \dots, X_K\} \subseteq \Sigma^r$  of solutions, allowing repetitions:

$$D_{d_H}^{\text{sum}}(\mathcal{X}) = \sum_{1 \le i \le K} d_H(X_i, X_j)$$
 Max-Sum Diversity (1)

$$D_{d_H}^{\min}(\mathcal{X}) = \min_{i < j} d_H(X_i, X_j) \qquad \text{Max-Min Diversity} \qquad (2)$$

#### **Notation**

A subset  $\mathcal{X}\subseteq \Sigma^r$  is  $\Delta$ -diverse w.r.t.  $D_{d_H}^{\tau}$  if  $D_{d_H}^{\tau}(\mathcal{X})\geq \Delta$  for some  $\Delta\geq 0$ .

Where for  $\tau \in \{sum, min\}$ ,  $D_{d\mu}^{\tau}$  denotes one of the two diversity measures.

# Two problems

# Problem 1: DIVERSE LCSs WITH DIVERSITY MEASURE $D_{d_H}^{\tau}$

Input: A set  $S = \{S_1, S_2, \dots, S_m\}$  of  $m \ge 2$  strings over  $\Sigma$ , an integer  $K \ge 1$  and  $\Delta \ge 0$ .

Question: Is there some set  $\mathcal{X} \subseteq LCS(S)$  such that  $\mathcal{X} = K$  and

 $D_{d_H}^{\tau}(\mathcal{X}) \geq \Delta$ ?

#### Problem 2: DIVERSE STRING SET

Input:  $K, r, \Delta \in \mathbb{Z}$  and a  $\Sigma$ -DAG G for a set  $L(G) \subseteq \Sigma^r$  of strings.

Question: Decide if there exists some subset  $\mathcal{X} \subseteq L(G)$  such that  $|\mathcal{X}| = K$ 

and  $D_{d\mu}^{\tau}(\mathcal{X}) \geq \Delta$ .

# $\Sigma$ -Labeled Directed Acyclic Graphs ( $\Sigma$ -DAGs)

#### **Definitions**

- Alphabet  $(\Sigma)$ : Set of symbols.
- String Set (Language):  $L = \{X_1, X_2, \dots, X_n\} \subseteq \Sigma^*$ , with:
  - Total Length:  $||L|| = \sum_{X \in L} |X|$
  - Max Length:  $\max \text{Len}(L) = \max_{X \in L} |X|$
- **r-String**: Any string X where |X| = r

#### **Σ-DAG** Structure

A graph G = (V, E, s, t) with:

- V: vertices, E: labeled edges (v, c, w) with  $c \in \Sigma$
- Source s and Sink t such that paths exist from s to all vertices
- **Size**: size(*G*), the number of its labeled edges

# $\Sigma$ -Labeled Directed Acyclic Graphs ( $\Sigma$ -DAGs)

Any path  $P = (e_1, e_2, ..., e_n)$  of outgoing edges *spells out* a string  $str(P) = c_1 c_2 ... c_n \in \Sigma^n$  where  $c_i$  is the label of edge  $e_i$ .

#### Language Representation

A  $\Sigma$ -DAG represents  $L(G) \subset \Sigma^*$ : all strings spelled from paths  $s \to t$ . Equivalent to an NFA over  $\Sigma$  with initial s, final t, and no  $\epsilon$ -edges.

#### Remarks

- For any set L of strings, a  $\Sigma$ -DAG G exists s.t. L(G) = L and  $\operatorname{size}(G) \leq ||L||$ . Construction time:  $O(||L||\log |\Sigma|)$ .
- If G represents a set L of r-strings ( $L \subseteq \Sigma^r, r \ge 0$ ), all paths  $s \to v$  have the same length  $d \le r$ .

# $\Sigma$ -DAGs for LCSs and Diverse String Sets

# Lemma ( $\Sigma$ -DAG for LCSs)

For any constant  $m \ge 1$  and set  $S = \{S_1, \ldots, S_m\} \subseteq \Sigma^*$  of m strings, there exists a  $\Sigma$ -DAG G of polynomial size in  $\ell := \max \{n(S) \}$  such that L(G) = LCS(S) and can be computed in polynomial time I

#### Consequence of the Lemma

- If MAX-MIN (or MAX-SUM) DIVERSE STRING SET solvable in  $f(M, K, r, \Delta)$ ,
- Then MAX-MIN (or MAX-SUM) DIVERSE LCSs on  $S \subseteq \Sigma^r$  solvable in  $O(|\Sigma| \cdot \ell^m + f(\ell^m, K, r, \Delta))$  time.

where  $\ell = \mathsf{maxlen}(S)$ 

# Exact Algorithms for Bounded Number of Diverse Strings

# Algorithm for MAX-MIN DIVERSE STRING SET problem

## Dynamic Programming Approach

**Pattern of Path Tuple:** For each  $d \le r$  and K-tuple of length-d paths  $P = (P_1, \dots, P_K)$ , define pattern Pattern $(P) = (\mathbf{w}, \mathbf{Z})$ , where:

- $\mathbf{w} = (w_1, \dots, w_K)$ : K-tuple of vertices representing endpoints of  $P_i$  paths.
- **Z** =  $(Z_{i,j})$ : Upper triangular matrix of Hamming distances, where  $Z_{i,j} = \min\{\Delta, d_H(\text{str}(P_i), \text{str}(P_j))\}.$

#### DP Table of Weights

Weights: 
$$V^K \times (\Delta \cup \{0\})^{K \times K} \to \{0, 1\}$$
 (3)

Boolean matrix where Weights( $\mathbf{w}, \mathbf{Z}$ ) = 1 iff ( $\mathbf{w}, \mathbf{Z}$ ) matches pattern Pattern(P) for some K-tuple of paths of length d from s to  $\mathbf{w}$ .

# Algorithm for MAX-MIN DIVERSE STRING SET problem

#### Algorithm 1

```
1: Set Weights(\mathbf{s}, Z) = 0 for all Z \in (\Delta \cup \{0\})^{K \times K} and Weights(\mathbf{s}, \mathbf{0}) \leftarrow 1
 2: for d \leftarrow 1, \ldots, r do
           for \mathbf{v} \leftarrow (v_1, \dots v_K) \in (V_d)^K do
 3:
                for (v_1, c_1, w_1) \in E^+(v_1), \dots, (v_K, c_K, w_K) \in E^+(v_K) do
 4:
 5:
                     Set \mathbf{w} = (w_1, \dots, w_K)
                     for U \in (\Delta \cup \{0\})^{K \times K} such that Weights(\mathbf{v}, U) = 1 do
 6:
                           Set Z = (Z_{i,i})_{i < i} with Z_{i,j} \leftarrow \min\{\Delta, U_{i,j} + \mathbb{1}\{c_i \neq c_i\}\}\ \ \forall \ i,j \in K
 7:
 8:
                          Set Weights(\mathbf{w}, Z) \leftarrow 1
                                                                                                                   ▶ Update
 9:
                     end for
                end for
10:
11:
           end for
12: end for
13: Answer Yes if Weights(t, Z) = 1 and D_{du}^{\min}(Z) \geq \Delta for some Z, else No
```

For any  $K \geq 1$  and  $\Delta \geq 0$ , it solves the MAX-MIN DIVERSE STRING SET problem in  $O(\Delta^{K^2}K^2M^K(\log |V| + \log \Delta))$  time and space when an input string set L is represented by a  $\Sigma$ -DAG G with size(G) =  $M_{\text{CL}}$  and M and M are M are M and M are M and M are M are M and M are M and M are M are M and M are M are M and M are M and M are M are M and M are M are M and M are M and M are M are M and M are M are M and M are M and M are M are M and M are M are M and M are M and M are M are M and M are M are M and M are M and M are M are M and M are M and M are M are M and M are M are M are M are M are M and M are M are M and M are M are M are M are M are M are M and M are M are M are M and M are M are

# Algorithm for MAX-SUM DIVERSE STRING SET problem

### Modify the Max-Sum Diverse String Set problem

Instead of the entire  $K \times K$  weight matrix Z, only the sum  $z = \sum_{i < j} d_H(\text{str}(P_i), \text{str}(P_j))$  is needed for computing Max-Sum diversity.

#### New DP Table Weights

For  $\mathbf{w} = (w_1, \dots, w_K)$  of depth  $0 \le d \le r$  and integer  $0 \le z \le rK$ , define:

$$\mathtt{Weights}(\mathbf{w},z)=1$$

if and only if there exists a K-tuple of length-d prefix paths  $(P_1, \ldots, P_K)$  from s to  $w_1, \ldots, w_K$  with sum of pairwise Hamming distances z.

# Algorithm for MAX-SUM DIVERSE STRING SET problem

#### Algorithm 2

```
1: Set Weights(\mathbf{s}, Z) = 0 for all Z \in (\Delta \cup \{0\})^{K \times K} and Weights(\mathbf{s}, \mathbf{0}) \leftarrow 1
 2: for d \leftarrow 1, \ldots, r do
          for \mathbf{v} \leftarrow (v_1, \dots v_K) \in (V_d)^K do
 3:
                for (v_1, c_1, w_1) \in E^+(v_1), \dots, (v_K, c_K, w_K) \in E^+(v_K) do
 4:
 5:
                     Set \mathbf{w} = (w_1, \dots, w_K)
 6:
                     for u \leftarrow (0, ..., rK) such that Weights(\mathbf{v}, U) = 1 do
 7:
                           Set Z = (Z_{i,j})_{i < j} with Z_{i,j} \leftarrow \min\{\Delta, u + \sum_{i < i} \mathbb{1}\{c_i \neq c_j\}\}
 8:
                           Set Weights(\mathbf{w}, Z) \leftarrow 1
                                                                                                                   ▶ Update
                     end for
 9:
                end for
10:
           end for
11:
12: end for
13: Answer Yes if Weights(\mathbf{t}, Z) = 1 and D_{du}^{\min}(Z) \geq \Delta for some Z, else No
```

For any  $K \geq 1$ , it solves the MAX-SUM DIVERSE STRING SET under Hamming Distance in  $O(\Delta K^2 M^K(\log |V| + \log \Delta))$  time and space, where M is the size of the input  $\Sigma$ -DAG G

# Approximation Algorithms for Unbounded Number of Diverse Strings

# MAX-SUM DIVERSE STRING SET problem

Use a local search algorithm for computing approximate solutions  $\mathcal{X} \subseteq \mathcal{L}$  with  $|\mathcal{X}| = K$  on a finite metric space  $(\mathcal{L}, d)$ , where  $d : \mathcal{L} \times \mathcal{L} \to \mathbb{R}_{\geq 0}$ .

### **Algorithm 3** LocalSearch $(\mathcal{L}, K, d)$

```
1: \mathcal{X} \leftarrow arbitrary set of K solutions in \mathcal{L}

2: for i \leftarrow 1, \dots, \lceil \frac{K(K-1)}{K+1} \log \frac{(K+2)(K-1)^2}{4} \rceil do

3: for X \in \mathcal{X} s.t \mathcal{L} \setminus \{X\} \neq \emptyset do

4: Y \leftarrow \operatorname{argmax}_{Y \in \mathcal{L} \setminus \{X\}} \sum_{X' \in \mathcal{X} \setminus \{X\}} d(X', Y)

5: \mathcal{X} \leftarrow \mathcal{X} \setminus \{X\} \cup \{Y\}

6: end for

7: end for

8: return \mathcal{X}
```

#### Theorem

When the distance d is a semi-metric of negative type over  $\mathcal{X}$ , then LocalSearch has improved approximation ratio  $(1-\frac{2}{K})$  for any  $K \geq 2$ . The Hamming distance  $d_H$  over the set of r-strings is a semi-metric of negative type.

# MAX SUM FARTHEST r-STRING problem

How do we solve efficiently the following problem?

$$Y \leftarrow \mathsf{argmax}_{Y \in \mathcal{L} \setminus \{X\}} \sum_{X' \in \mathcal{X} \setminus \{X\}} d(X', Y)$$

#### Algorithm 4 Decisional MAX-SUM FARTHEST r-STRING

```
1: Set Weights(s,z) := 0 for all z \in [\Delta]_+, and Weights(s,0) := 1

2: for d := 1, \ldots, r do

3: for 0 \le u \le \Delta such that Weights(v,u) := 1 do

4: Set Weights(w,z) := 1 for z := u + \sum_{i \in [K]} \mathbb{1}\{c \ne X_i[d]\} \triangleright Update
```

- 5: end for 6: end for
- 7: Answer YES if  $Weights(t, \Delta) = 1$ , and NO otherwise

▷ Decide

# Theorem (Polynomial Time Approximation Scheme for unbounded K)

When K is part of an input, MAX-SUM DIVERSE STRING SET problem on a  $\Sigma$ -DAG admits a PTAS

Fixed-Parameter Tractable (FPT)
Algorithms for Bounded Number and
Length of Diverse Strings

# FPT Algorithms for Max-Min and Max-Sum Diverse String Set problems

# Definition (Fixed-Parameter Tractable (FPT) Algorithm)

A problem parametrized with  $\kappa$  is said to be *fixed-parameter tractable* (FPT) if there exists an algorithm for the problem running on an input x in time  $f(\kappa(x)\cdot|x|^c)$ , where f is a computable function and c>0 is a constant.

### Proposed FPT Algorithm

Color-coding technique with dynamic programming to solve these problems efficiently. Assign a random color to the edges of the  $\Sigma$ -DAG G, creating a colored graph called C-DAG, then reduce it to a trie T.

#### Theorem

For any set C of k colors, there exists some C-DAG H obtained by reducing c(G) such that L(H) = L(c(G)) and  $||H|| \le k^r$ .

# Computation of Reduced C-DAG

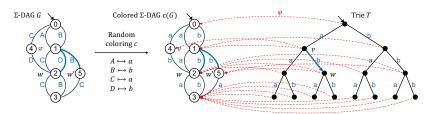

Figure: Computation of reduced C-DAG H from an input  $\Sigma$ -DAG G over alphabet  $\Sigma = \{A, B, C, D\}$ , which shows G (left), a random coloring C on  $C = \{a, b\}$ , a colored C-DAG C(G) (middle), and a reduced C-DAG C in the form of trie C (right)

#### Theorem

When r and K are parameters, the MAX-MIN (MAX-SUM) DIVERSE STRING SET on a  $\Sigma$ -DAG for r-strings is fixed-parameter tractable (FPT), where size(G) is an input.

# Complexity Results for Diverse String Problems

## Negative Results

- NP-hard for unbounded K (MAX-MIN, MAX-SUM) in  $\Sigma$ -graphs for r-strings,  $r \geq 3$ .
- W[1]-hard parameterized with K for MAX-MIN and MAX-SUM in  $\Sigma$ -DAGs.

#### Reduction to Diverse LCSs

MAX-MIN and MAX-SUM problems are FPT-reducible to DIVERSE LCSs for m = 2 strings.

#### Corollaries

NP-hard and W[1]-hard results extend to DIVERSE LCSs for two r-strings.

#### Conclusion

- Polynomial-Time Solutions: When K is bounded, both the MAX-SUM and MAX-MIN versions of DIVERSE STRING SET and DIVERSE LCSs can be solved in polynomial time using dynamic programming (DP).
- **PTAS** for Input-Based K: For input-dependent K, the MAX-SUM versions of both DIVERSE STRING SET and DIVERSE LCSs admit a PTAS using local search due to the Hamming distance being a metric of negative type.
- **Fixed-Parameter Tractability (FPT)**: Both versions are FPT when parameterized by *K* and *r*, combining the color coding technique and DP.
- NP-Hardness for Constant  $r \ge 3$ : When K is part of the input, both the MAX-SUM and MAX-MIN versions are NP-hard for any constant r > 3.
- **W[1]-Hard for Parameterized** *K*: Parameterized by *K*, both versions are W[1]-hard.
